D-Dance

直接搜索会出现多组重复数据导致超时如果每次从当前**未选中**人中的**最小**的编号作为一对人中第一个,并依次向下枚举可以避免最后整体选择重复对选出的整体数据进行验证即可.

```
const int max n = 2*8+2;
int aff[max_n][max_n],ans;
bool flag[20];
int n;
std::vector<std::pair<int,int>> parten;
void dfs(int deep){
    if(deep == n+1){}
        int temp = 0;
        for(auto it : parten)
            temp ^= aff[it.first][it.second];
        ans = std::max(ans,temp);
        return;
    }
    int 1;
    for(int i = 1; i < 2*n; i++){
        if(!flag[i]){
            l = i;
            break;
        }
    }
    flag[1] = 1;
    for(int i = 1; i \leftarrow 2*n; i++){
        if(!flag[i]){
            parten.push_back({1,i});
            flag[i] = 1;
            dfs(deep+1);
            parten.pop_back();
            flag[i] = 0;
        }
    flag[1] = 0;
}
int main(){
    scanf(" %d",&n);
    for(int i = 1; i < 2*n; i++)
        for(int j = i+1; j <= 2*n; j++)
            scanf(" %d",&aff[i][j]);
```

```
dfs(1);
printf("%d\n",ans);
return 0;
}
```

E-Average and Median

可以使用二分搜索来得到答案关键在答案的检查上

平均数的检查:
 因为必须至少选择第i和第i+1张中一张牌使用dp_e[i]表示到i张牌时最大的平均数用add[i]表示第i张牌加入时的贡献所以有:

```
dp_e[i] = max(dp_e[i-1]+add[i],dp_e[i-2]+add[i]);
```

对dp_e[n],dp_e[n-1]检查

中位数的检查:

 it为待检查数
 当 b[i] = (array[i] >= it)? 1:-1;

 用额外标记flag去掉i或i+1中的小于it的数,表示不选对b[]的总和进行检查

```
const int max_n = 1e5+10;
const double eps = 1e-6;
int n,array[max_n];
double dp_e[max_n];
bool check_mid(int it){
    int sum_ = 0,flag = 1;
    for(int i = 1; i <= n; i++){
        if(flag && array[i] < it){</pre>
            flag = ∅;
            continue;
        }
        else{
            flag = 1;
            sum_ += (array[i] >= it ? 1 : -1);
        }
    return sum_ > 0;
}
bool check_ever(double it){
```

```
dp_e[1] = 1.0 * array[1] - it;
    for(int i = 2; i <= n; i++){
        double temp = 1.0 * array[i]-it;
        dp_e[i] = std::max(dp_e[i-1]+temp,dp_e[i-2]+temp);//
    return (dp_e[n]+eps > 0 \mid \mid dp_e[n-1]+eps > 0);
}
void bin_mid(){
    int l = 1, r = 1e9;
    while(1 <= r){
        int mid = (1+r) >> 1;
        if(check_mid(mid))
            1 = mid+1;
        else
            r = mid-1;
    printf("%d\n",1-1);
}
void bin_ever(){
    double l = 0 , r = 1e9;
    while(r-l > eps){
        double mid = (1+r)/2;
        if(check_ever(mid))
            1 = mid;
        else
            r = mid;
    printf("%.9f\n",1);
}
int main(){
    scanf(" %d",&n);
    for(int i = 1; i <= n; i++){
       scanf(" %d",&array[i]);
    bin_ever();
    bin_mid();
    return 0;
}
```
